

Digi Khata:

Summary

Digi Khata is a digital account management application designed to help users maintain customer records and transaction history efficiently. The application allows users to add customers by entering their name and mobile number. Once a customer is added, all financial transactions related to that customer are recorded and stored securely within the system.

The app maintains a complete transaction history for each customer, enabling users to easily track payments, dues, and financial relationships. Digi Khata simplifies manual record-keeping by providing a structured and organized digital solution. It is especially useful for small business owners, shopkeepers, and freelancers who need an easy and reliable way to manage daily financial transactions.

The main goal of this project is to reduce errors in traditional bookkeeping, improve data accessibility, and provide a user-friendly platform for managing customer accounts digitally.
